## **Discussion**

The discussion started with Mark (Development Coordinator) making a small remark arguing that Agile can work with small groups (our case), it helps when people are inexperienced (also our case) and the incrementation characteristic of Agile would also be beneficial since we are still very early on the project and do not have a clear picture of full requirements.

Lucas (Requirements Coordinator) continued the discussion stating that Waterfall looks simpler to be adopted but since we are probably going to keep making submission on the form of assignments Agile would also be a better fit with those continued deliveries and feedback (fact that does not sit well with the Waterfall characteristic of making one big final delivery in the end).

Mark agreed and remembered that since we also do not have all the knowledge necessary, planning out things very far ahead of time would be out of our reach. Lucas agreed and made a positive comment regarding the way Agile treats documentation (not prioritizing it over working code) and the way Agile deals with the customer in a more close and participative way.

Kyle finished the discussion agreeing that the Agile method would be a better fit since it works with small increments instead of big deliveries like Waterfall.

**Pros and Cons List**

Agile		Waterfall	
Pros	Cons	Pros	Cons
Small deliveries periodically	Complex to understand	Simpler to understand	Big delivery
Closeness with client	Complex to Adopt	Simpler to adopt	Planning far ahead
Documentation			

**Result**

Agile is going to be adopted.
